“No Turning Back” is the first tale in this book which contains a variety of human interest stories, some humorous, some to stir your imagination - even a children’s story written to be read to small people. Some tales are personal, drawn from my own experiences. Human beings and how they cope with adversity has always inspired me to write. I will leave my readers to decide which are true, and which are fictitious. Enjoy what you will.

The Elements of Theoretical and Descriptive Astronomy Springer Science & Business Media

Built from the ground up on our new understanding of the universe, this reader-friendly book focuses on central ideas and unifying themes to provide a concise cosmic context. Scientific concepts are linked to everyday experience to help readers develop an appreciation for the scientific method and to see how

physics and astronomy are foundations for understanding their world. Recent discoveries spark readers' curiosity in the universe as a whole. Updates include discoveries such as the accelerating universe/cosmological constant, the detection of more planets around other stars, the potential of water flow on Mars, and the latest theories on the very early universe. For college instructors and students, or anyone interested in astronomy and physics.

Mathematical programming has known a spectacular diversification in the last few decades. This process has happened both at the level of mathematical research and at the

level of the applications generated by the solution methods that were created. To write a monograph dedicated to a certain domain of mathematical programming is, under such circumstances, especially difficult. In the present monograph we opt for the domain of fractional programming. Interest of this subject was generated by the fact that various optimization problems from engineering and economics consider the minimization of a ratio between physical and/or economical functions, for example cost/time, cost/volume, cost/profit, or other quantities that measure the efficiency of a system. For example, the productivity of industrial systems, defined as the ratio between the realized services in a system within a given period of time and the utilized resources, is used as one of the best indicators of the quality of their operation. Such problems, where the objective function appears as a ratio of functions, constitute fractional programming problem. Due to its importance in modeling various decision processes in management science, operational research, and economics, and also due to its frequent appearance in other problems that are not necessarily economical, such as information theory, numerical analysis, stochastic programming, decomposition algorithms for large linear systems, etc., the fractional programming method has received particular attention in the last three decades.

Rapid growth of geodetic information provided by the Global Positioning System (GPS) and stringent requirements for a precise geoid in ocean areas for ocean circulation models have spurred interest in geoid studies. As a result, the International Geoid Commission was formed to provide a focus for this

important geoid research. Determination of the Geoid: Present and Future is the result of the first meeting of the Commission, held at the Instituto di Topografia, Fotogrammetria e Geofisica at the Politecnico di Milano, June 1990. Six major topics are presented: Global Geopotential Models: Present and Future; Role of Topography in Geoid Computations; the Geoid and the Global Positioning System; the State of Computation of National or Regional Geoids; Software and Data Improvements for Geoid Computations; and Recent Developments in the GEOMED (Determination of the Geoid in the Mediterranean) Project.

General relativity ranks among the most accurately tested fundamental theories in all of physics. Deficiencies in mathematical and conceptual understanding still exist, hampering further progress. This book collects surveys by experts in mathematical relativity writing about the current status of, and problems in, their fields. There are four contributions for each of the following mathematical areas: differential geometry and differential topology, analytical methods and differential equations, and numerical methods.

BodyStories is a book that engages the general reader as well as the serious student of anatomy. Thirty-one days of learning sessions heighten awareness about each bone and body system and provide self-guided studies. The book draws on Ms. Olsen's thirty years as a dancer and teacher of anatomy to show how our attitudes and approaches to our body affect us day to day. Amusing and insightful personal stories enliven the text and provide ways of working with the body for efficiency and for

healing. BodyStories is used as a primary text in college dance departments, massage schools, and yoga training programs internationally.

This monograph presents recent developments in spectral conditions for the existence of periodic and almost periodic solutions of inhomogeneous equations in Banach Spaces. Many of the results represent significant advances in this area. In particular, the authors systematically present a new approach based on the so-called evolution semigroups with an original decomposition technique. The book also extends classical techniques, such as fixed points and stability methods, to abstract functional differential equations with applications to partial functional differential equations. Almost Periodic Solutions of Differential Equations in Banach Spaces will appeal to anyone working in mathematical analysis.

Hardly any book tells more about the history of Chicago Blues. Hardly any biography reveals more anecdotes and secrets of the

Blues. Tampa Red (ca. 1903 - 1981) should be mentioned in the same breath with legends like Robert Johnson, Muddy Waters or B.B. King. For more than 20 years Tampa Red set the tone in Chicago; the first with a brass guitar, one of the first with an electric guitar, pioneering slide virtuoso, author of more than 300 song pearls, mentor of many later stars. But Hudson Whittaker, as his real name was, lost glory and health towards the end of his life, died lonely as a forgotten man. To this day, no comprehensive book has been published, no film, nothing. Unbelievable! Now, finally, this great gap in blues literature is filled. The award-winning Swiss book author and blues musician Richard Koechli traces Tampa Red's life sensitively and historically precisely and prepares a worthy end for him with the help of a literary trick. Embedded in a fictional conversation with the young nursing assistant Anna and her music-obsessed friend Eric, Koechli lets Hudson Whittaker tell his own story right before his death: About life in Chicago, about love, about his music and his songs, about famous and less famous colleagues, about grief, despair, about the fear of dying - and finally about the happiness of reconciliation with his own history. "Thrilling like a thriller, touching like a drama, clarifying like a history book," raves the online magazine bluesnews.ch. "With this book, Koechli makes public an important and hitherto hardly noticed chapter in music history; for Blues fans a bubbling source of knowledge with plenty of aha moments." Finally, an English translation of the original German edition published in 2017 is now available; optionally as hardcover, softcover, e-book and large print book.

It could have been considered a whirlwind event, but it was more

like a hurricane of circumstances and political intrigue that brought him to the Galaef. No one at this level of government would take an interest in the myth of the Aeolian Master, unless there was some nefarious subplot lurking just below the surface. But why had they involved him--a nobody from an insignificant planet?
